OIL BATH BEARINGS

Issue Date 1st July 2007 - replaces all previous updates

OIL BATH BEARING ASSEMBLY

The Tatu Oil Bath Bearing Assembly is known and used world-wide by OEM's and primary producer's alike. The dual tapered TIMKEN roller bearings can absorb radial and axial loading, whilst constantly running in an oil bath.

Critical to the success of any bearing in a ground engaging role is the performance of the seal. TATU Oil Bath Bearing assemblies utilise the successful Caterpillar DUO-CONE seal design. Two "O Rings", and two metallic rings with stone tracks at each seal provide for virtually maintenance free operation for extended operational periods.

Price available on request.
